

Planting Daffodils

Class 1 looked at what plants need to grow.

The first thing the children decided plants need is sunshine.

The next thing they need is water.

The last thing they decided they need is soil.

Once we had decided what we needed the children looked at daffodil bulbs. They decided that we would see if they would grow if we gave them the three things we decided they needed. So class 1 decided to carry out an experiment.

We planted one bulb into six plastic see through containers. We put some soil into the container and then put the bulb on top. We then covered it with soil and poured some water into it. After that we put them on the window sill of the classroom and will be watching to see what happens.

Below are some photos of the children carrying out the experiment and enjoying getting very muddy.
